IN THE ABSTRACT

Please delete the present abstract in its entirety, and replace it with the version provided below.

There is provided a method for adaptation of an intelligent unit to a location in a system. The method includes (a) associating a configuration device with the location, wherein the configuration device is connected to a coupling location for the intelligent unit in the system, and (b) storing data in the configuration device. The data is transmitted from the configuration device to a logic device that processes the data for configuration of the intelligent unit in the system.
